4. Discrepanze

- L'obiettivo del lavoro è rispondere alla domanda:
  "Can violent conflict in the form of civil war affect the strength of civil society at the country level?"
- Studio comparativo
- Cinque paesi colpiti da guerre civili nella seconda metà del XX secolo: Sierra Leone, Burundi, Uganda, Nepal e Liberia.

Fonti dei dati

- Armed Conflict Dataset (threshold inizio conflitto) da Uppsala Conflict Data Program
- V-dem dataset (core civil society index, electoral democracy)
- Penn World Tables (log GDP, log population, human capital)
- LaPorta, Lopez-de-Silanes, and Shleifer 2008 (legal origin)

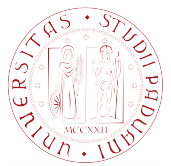

Variabile risposta

- Viene utilizzato il "Core Civil Society Index" dal dataset V-Dem, che risponde alla domanda:

  "How robust is civil society?"

- L'indice è costruito a partire da:
  - "CSO participatory environment"
  - "CSO entry and exit"
  - "CSO repression"

Analisi descrittive covariate

Variable	Mean	SD	Max	Min	N
Core Civil Society Index	0.53	0.32	0.98	0.01	8068
Log GDP per capita	8.47	1.22	12.41	4.96	7153
Log Population	1.92	1.75	7.20	-3.21	7153
Electoral Democracy	0.40	0.29	0.94	0.01	8049
Distance Equator	0.27	0.19	0.72	0.00	8071
Human Capital	2.01	0.71	3.7	1.01	6406

Tabella 1: progetto

Variable	Mean	SD	Max	Min	N
Civil Society Participation Index	0.55	0.29	0.99	0.02	6700
Core Civil Society Index	0.56	0.31	0.98	0.01	6700
Log GDP per capita	8.52	1.24	12.41	4.96	6406
Log Population	2.14	1.63	7.20	-2.21	6406
Electoral Democracy	0.43	0.29	0.94	0.01	6682
Distance	0.29	0.19	0.72	0.00	6703
Human Capital	2.01	0.71	3.70	1.01	6406

2. Synthetic control method
   - Placebo test
3. Risultati
4. Discrepanze

Synthetic control method

- Metodologia data-driven
- L'idea è costruire un "synthetic control" come combinazione lineare di parte delle regioni di controllo
- I pesi sono assegnati in modo da assomigliare al trattato pre-intervento in termini di:
  - predittori dell'outcome
  - trend dell'outcome

Placebo test

Il placebo test viene utilizzato per valutare l'efficacia del SCM:

- Il SCM viene applicato a ciascun potenziale controllo del campione.
- Graficamente si valuta se l'effetto del trattamento (nel nostro caso, il conflitto) è significativamente più ampio rispetto agli effetti stimati per le regioni senza trattamento
- Consente di:
  - Calcolare i p-value per la significatività del trattamento per i singoli anni post-trattamento
  - Effettuare un F-test per la significatività congiunta dell'effetto negli anni post trattamento
